

What do you know about radon levels in your area?

The U.S. EPA and the U.S. Geological Survey have evaluated the radon potential in the U.S. and have developed this map to assist National, State, and local organizations to target their resources and to assist building code officials in deciding whether radon-resistant features are applicable in new construction. This map is not intended to be used to determine if a home in a given zone should be tested for radon. Homes with elevated levels of radon have been found in all three zones. All homes should be tested regardless of geographic location. The map assigns each of the 3,141 counties in the U.S. to one of three zones based on radon potential. Each zone designation reflects the average short-term radon measurement that can be expected to be measured in a building without the implementation of radon control methods. The radon zone designation of the highest priority is Zone 1.

EPA Map of Radon Zones

-  Zone 1 Highest Potential (greater than 4pCi/L)
-  Zone 2 Moderate Potential (from 2 to 4pCi/L)
-  Zone 3 Low Potential (less than 2 pCi/L)
